27 October 2026

Dear Hiring team,

I’m applying for the Senior DevOps Engineer role (4-day week) in Belfast. The advert asks for Terraform, Kubernetes in production and engineers who own reliability without a separate SRE team. That’s close to how I work at Reward, where I run high-volume banking platforms on AWS and Kubernetes and I’m the go-to engineer for production incidents.

Relevant experience:

- I work with Terraform, Helm and Istio, and fixed a customer-facing Kubernetes/Istio ingress outage by correcting the Helm deployment templates behind it.
- I stopped recurring daily out-of-memory crashes in a transaction ingestion service, and made a month-end invoicing batch fail safely with per-partner error isolation, timeouts and retries.
- I automated scheduled processing with EventBridge, Lambda and Fargate, and wrote runbooks so our production services team resolves repeat issues without escalation.
- I planned AWS SDK and Node runtime upgrades across repositories and bank deployments, and remediated critical vulnerabilities for PCI DSS.

To be clear about the gap: my cloud experience is AWS rather than GCP. The Terraform and Kubernetes skills carry straight across, and I’d expect to pick up GCP quickly during your migration.

Thank you for considering my application. I’d welcome a conversation.

Kind regards,

Padraig Lavery
