27 October 2026

Dear Ryan,

I'd like to be considered for the Senior Software Engineer (TypeScript / Node.js) role with your Series B KYC and compliance client. A regulated product where data integrity is non-negotiable is the environment I've worked in for four years at Reward, building and running Node.js and .NET services for UK and Middle East banking clients.

Why I think I fit:

- **Regulated domain:** I designed audit logging of staff access to customer accounts across bank portals for client security audits, and remediated critical vulnerabilities for PCI DSS compliance.
- **API and service layer:** I standardised input validation across partner microservices and removed stack traces and SQL details from error responses, so bad requests no longer reach the database.
- **Correctness at volume:** I redesigned a month-end invoicing batch with per-partner error isolation, timeouts and safe retry and reconciliation, and stopped recurring memory crashes in a high-volume ingestion service.
- **Platform:** I work with AWS Lambda, Fargate, Kubernetes, Helm and MongoDB, and led a cross-team initiative for automated API testing and stable CI.

On experience: the advert asks for five years. I have over four years full-time at Reward, plus a year as a software engineering intern at Flexera building a Go API on Docker and Kubernetes.

I'm based in Belfast, so hybrid or remote within NI suits me. Happy to talk whenever works for you.

Kind regards,

Padraig Lavery
