27 October 2026

Dear Hiring team,

I’m applying for the Senior DevOps Engineer role (£70k–£80k) with your Belfast technology client. The advert asks for hands-on Kubernetes and a record of building and improving automated delivery pipelines. Both are central to my four years at Reward, running high-volume banking platforms on AWS and Kubernetes.

Relevant experience:

- **Kubernetes in production:** I resolved a customer-facing outage caused by malformed load-balancer naming in our Kubernetes/Istio ingress, and corrected the Helm deployment templates so it couldn’t recur.
- **Pipelines:** I stabilised GitHub Actions CI as part of a cross-team test automation initiative, including fixing a GitHub App token authentication issue that had been blocking test runs, and built the CI/CD pipeline for a UI Builder service.
- **Automation:** I replaced manually triggered processing with EventBridge, Lambda and Fargate, and work with Terraform and Helm.
- **Reliability:** I’m the go-to engineer for production incidents on my team, and I write the runbooks that stop repeat issues reaching engineering.

I’ve also led AWS SDK and Node runtime upgrade planning across repositories and bank deployments, and remediated critical vulnerabilities for PCI DSS.

Thank you for considering my application. I’d be glad to talk.

Kind regards,

Padraig Lavery
